ABSTRACT

2	A child positioning apparatus for X-ray photography having
3	improved adjustment mechanisms. In particular the positioning of
4	the X-ray film cassette has been improved by using a friction
5	fastner. The friction fastner passes through a groove in the
6	vertical portion of a L-bracket and attaches to a tray for
7	holding the X-ray film. The position of the tray is adjusted by
8	loosening the friction fastener, positioning the tray and then
	re-tightening to fix the X-ray film cassette into place.
